Use cases
MSIS 554, Prof. Robin Burke
Due: 2/14

Objective
To create use cases that represent the role and scope of your part of the i-Notes system.

Activity
Brainstorm about your team’s mission within the overall system architecture discussed in class. Create use cases that describe each kind of interaction that a user might have with your part of the system or a point at which some other component might call upon it. For each use case, complete the following outline:

I. Name – a succinct name for the interaction this use case represents.
II. Actors – the role of individual who play a part in this interaction.
III. Expected path – a list of interactions that would be expected in a successful completion of this interaction.
IV. Exceptions – a list of exception or error conditions that would cause the system not to follow the expected path.
V. Dependences – note any points at which this use case depends on some part of the system outside of your implementation

Submission
Submit hard copies of your use case outlines, one per page, at class time on the 14th. You may divide up the work between team members however you wish.
